Crop: Maize (*Zea Mays)* - EPPO code: ZEAMX

Pathogen: Maize blight (Turcicum Leaf Blight) Exserohilum turcicum – EPPO Code: SETOTU

**

Suggested control Measures:

Agronomic Control:

- Rotate crops to avoid disease build-up.
- Use resistant maize varieties.
- Plant early to avoid peak disease pressure.
- Destroy infected crop residues

Biological Control:

- Biological fungicides like Trichoderma spp. can be used to suppress the pathogen in the soil.

Chemical Control:

- Fungicides like Mancozeb, Propiconazole, or Tebuconazole are effective for blight control when applied early in disease development.
